Chronology - isolated research blocks

Metric	In-sample	Strict model-weight OOS
Period	Jan 2018 - Jul 2022	30 Jul 2022 - 12 Aug 2026
Trades	151	210
SQN	5.348	2.129
Simple return	+733.7 pt	+253.9 pt
Win rate	63.6%	50.5%
Maximum drawdown	31.04 pt	25.34 pt
Profit / drawdown	23.63	10.02

What changed after the signal model was frozen

- The production signal binary is the exact frozen seven-input T1071 XGBoost model. No automatic retraining is used.
- Stop-loss audit: the historical non-interference knee was 7.30 ATR; the deployed catastrophic stop is 7.75 ATR.
- Take profit: 2.40 ATR for SHORT and 2.52 ATR for LONG.
- Execution timing: SL is active from entry; strategy TP is attached only from the start of D1 #2.
- Activating TP on D1 #1 changed only 6 of 210 strict OOS trades and the effect reversed sign across sub-periods, so the delayed TP was retained.
- Gap-close logic is OFF. When TP and SL are both reachable in the same active bar, the conservative ordering is SL first.

Deployment reading

- Strict post-weight OOS contains 210 trades, SQN 2.129, +253.9 simple points and 25.34 pt maximum drawdown.
- The OOS win rate is 50.5% and the observed rate is about 4.3 trades per month.
- Research returns and drawdowns are reported at 1:1 notional-equivalent exposure. Maximum live leverage ceiling: 2:1.
- Historical OOS is not a live track record. New evidence is now accumulated through the public forward record.
- The V111 uninterrupted 2018-2026 replay contains 361 exact trades and ends at +992.65 pt with a 31.04 pt max drawdown.
- The continuous curve preserves position state across the 2022 boundary, so it is not forced to equal the sum of the two isolated phase replays.

Observed OOS timing

- Median entry-to-exit timestamp: 96 h
- Average entry-to-exit timestamp: 146.7 h
- A live TP or SL may execute intraday; D1 timestamps do not imply the position remained open until the bar close.

Exits - count and average by type

reverse_long	n=120	-1.47%/tr	closes SHORT on a LONG signal
reverse_short	n=118	-1.73%/tr	closes LONG on a SHORT signal
tp_atr	n=123	+11.17%/tr	strategy ATR take profit

Take profit concentrates the gains: TP exits contribute +1373.6 pt. Reversals are 66% of all exits and are negative on average; the observed edge comes from allowing winners to reach the strategy TP.

By side

LONG	n=192	sum +594.0 pt	WR 58.3%	mean +3.09%
SHORT	n=169	sum +398.7 pt	WR 53.8%	mean +2.36%

Both sides are positive in the full continuous replay. Median holding time is 5 D1 bars; average 6.5; maximum 30.

READING NOTES

- Exact V111 full continuous curve: 361 trades from Jan 2018 to 3 Aug 2026.
- On page 1 the dark segment is the in-sample chronology and the red segment is the post-weight portion of the continuous replay.
- All percentages are simple percentage points per trade, summed without compounding.
- The strict model-weight OOS metrics on page 2 come from the isolated post-weight replay and are intentionally kept separate from the uninterrupted curve.
- SL is active immediately at 7.75 ATR. TP is not placed on the entry D1; it becomes active from D1 #2 at 2.40 ATR SHORT / 2.52 ATR LONG.
- Research statistics use 1:1 equivalent exposure. Maximum live leverage ceiling is 2:1.
- * 2026 data in this report ends on 3 August 2026.
